Impeller meters in the supply of chilled or hot water for industrial processes

In industrial processes where hot or chilled water is supplied, it is important for the monitoring of each single process to receive information upon energy load or any process problem.

**Target**
Monitoring and evaluation of energy fluxes: E/t (kW, Watt) in industrial processes.

**Solution**
Optimal monitoring and evaluation of single energy consumptions is made with an energy monitoring system from the 1500 series and 200 series. The measuring data can be transmitted to an external central station with display of the whole energy consumption or of the totalized flow.
